1 APPLICATION

The ND30BAC meter is a programmable digital instrument designed for the measurement of 1-phase 2-wire and 3-phase 3 and 4-wire power network parameters in balanced or unbalanced systems. The measured values are displayed on a 3,5'' TFT full-color screen, resolution: 320x240 pixel. The meter enables control and optimization of the power electronic devices, systems and industrial installations.
The meter provides measurement of: RMS of voltage and current, active, reactive and apparent power, active, reactive and apparent energy, power factors, frequency, the harmonics of current and voltage /up to 51st/, THD of voltage and current, averaged active and apparent power P Demand, S Demand, averaged current I Demand /15, 30 or 60 minutes/. Voltages and currents are multiplied by given voltage and current ratios of the measuring transformers. Power and energy indications take into account all programmed ratio values. The value of each measured value can be transmitted to the master system via the RS-485 or Ethernet/ BACnet IP interface. Relay outputs signal the overflow of the chosen value, the programmable analog output maps the assigned parameter. Depending on the version, the ND30BAC meter has 2 Pt100 temperature inputs or 2 galvanically separated binary inputs. Temperature inputs can be used to control the temperature of transformer windings, motors.

There is a galvanic separation between following units of the meter:

- supply
- voltage inputs
- current inputs
- RS485 interface
- Ethernet/BACnet IP interface
- alarm outputs
- temperature inputs Pt100
- binary inputs 0/5...24 v d.c.

2 METER SET

Complete set of the meter includes:

1. ND30BAC meter	1 pc
2. seal	1 pc
3. screw clamp to fix in the panel	4 pcs
4. plug with 16 screw terminals	1 pc
5. plug with 14 screw terminals	1 pc
6. user's manual	1 pc

3 BASIC REQUIREMENTS, OPERATIONAL SAFETY

In terms of operational safety the controller meets the requirements of the EN 61010-1 standard.

Remarks concerning safety:

- The meter should be installed and connected only by a qualified personnel. All relevant safety measures should be observed during installation.
- Always check the connections before turning the meter on.
- Prior to taking the meter housing off, always turn the supply off and disconnect the measuring circuits.
- Removal of the meter housing during the warranty period voids the warranty.
- This meter conforms to all requirements of the electromagnetic compatibility in the industrial environment.
- A switch or a circuit-breaker should be installed in the building or facility. It should be located near the device, easily accessible by the operator, and suitably marked.

4 INSTALLATION

The meter is intended to be fixed to the panel with mounting brackets as presented on Fig. 1. The meter housing is made of a self-extinguishing plastics.

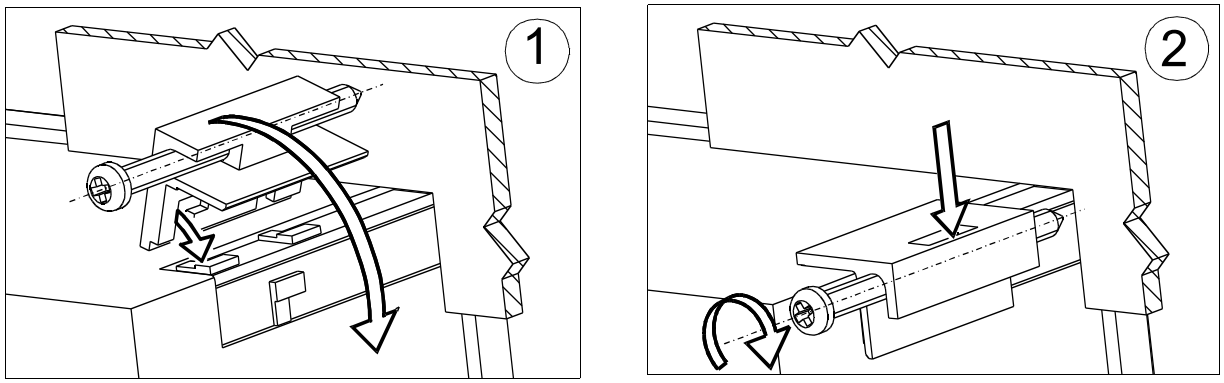

Fig. 2. Meter fitting

Housing overall dimensions 96 x 96 x 77 mm, dimensions of the assembly hole 92.5 x 92.5 mm. There are screw terminal strips on the outer side of the meter which enable the connection of external wires of diameter up to 2.5 mm^2.

5 METER DESCRIPTION

5.1 Current inputs

All current inputs are galvanically isolated (internal current transformers). The meter is adapted to work with external measuring current transformers / 1 A or 5 A /. Displayed current values and derivative values are automatically converted in relation to the introduced external current transformer ratio.

5.2 Voltage inputs

All voltage inputs are galvanically isolated (internal transformers). Values on voltage inputs are automatically converted according to the introduced ratio of the external voltage transformer. Voltage inputs are specified in the order as 3x57.7/100 V, 3x230/400 V or 3x110/190 V, 3x400/690 V.

5.3 External connection diagrams

External connections are shown in Fig. 4 and 4a.

6 ND30BAC PROGRAMMING

6.1 Front panel

Fig. 8. Front panel

The ND30BAC meter has 6 buttons and a full-color graphic screen.
Front panel description:

f1, ... , f8	8 field displays - the digits for readout and settings,	DMD	Averaged value indicator (Demand)
V, A, W, var, VA, Wh, varh, Hz,	units of the displayed values	k, M	kilo = $10^{3,}$ Mega = 10^{6}
U1, I1, P1, ...EnQ	displayed parameters markings	⏚ ξ	The markers indicating the inductive, capacity load character

The values of the measured parameters are shown on the active pages selected by subsequent pressing the buttons ▶ (next page) or ◀ (previous page).
The page consists 8 values selected from the Table 1 and displayed simultaneously on the display. The page definition is described in the **Display** group. Depending on the location, meter buttons can perform different functions. Functions are described in the bar on the bottom of the screen. If the button lacks description, it is inactive at the moment.

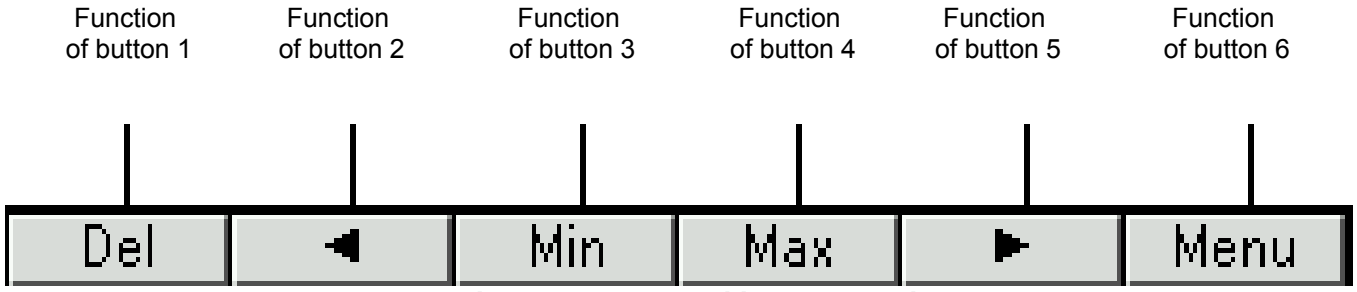

Fig. 9. Buttons marking – example

Information bar at the top of the screen displays the status of the alarm outputs, alarm conditions, T1 and T2 temperature of the sensors connected to the first and second input of PT100, state of binary inputs B1 and B2, a symbol of Ethernet connection, the indicators of receiving and transmitting data on the RS485 link, date and real-time clock. A symbol "phase sequence error" will be blinking in case of a negative phase sequence.

6.2 Starting work

After switching the supply on, the meter displays the ND30BAC meter name, version, current software version and MAC for the version with Ethernet and then moves to the measurement mode and last saved page. Displayed information:

ND30BAC v:0.80 – meter type, program version number

Bootloader v.01.06 – bootloader version number

U: 57.7/230.0 V – voltage versions

I: 1.0/5.0 A – current versions

MAC: AB:CD:EF:01:23:45

Fig. 11. Screen of meter measuring mode

6.3 Language selection

The preset language is English. To select a different language, press and hold the Menu button for about 10 seconds. The language selection menu will appear. The language selection is made with the ▲ or ▼ buttons and then confirmed again by pressing the OK button.

7 OPERATING MODES

During normal operation, the values are displayed according to the pre-programmed or user-configured pages in the **Display** parameter group.

The meter's menu is divided into parameter groups:

Parameters – meter parameters configuration

Alarms – Alarm 1, Alarm 2 configuration

Analog output – analog output configuration

Display – displayed pages configuration

Ethernet/ BACnet IP – Ethernet/ BACnet IP interface configuration

Modbus – RS485 interface parameters configuration

Settings – settings: password, language, time, date

Information – preview of a program version, serial number, MAC address

To enter the parameter menu, press the button **Menu** for approx. 3 seconds.

Buttons ▼ ▲ allow to select the appropriate mode, to accept press the button **Select**

To return to a measurement mode use the button **Exit**

7.1 Measurement mode

In the **Measure** mode the values are displayed according to the pages that are preset at the factory or configured by the user in the **Display** mode.
Changing the page is done by pressing the buttons ◄ or ►.
Preview of the maximum or minimum values respectively is done while the button **Max** or **Min** is pressed down. Reset of maximum or minimum values is done by pressing the button **Del** while viewing their values, i.e. first the button **Max** or **Min** and then **Del** must be pressed.

Simultaneously pressing the button **Max** and **Min** will copy internal memory to files archive.

When reactive power or reactive inductive or capacity energy is displayed, this indication is accompanied by a symbol of the load character: ⫰ for an inductive load or ⫟ for a capacity load.
When displaying the active power, the sign "+" is displayed for active energy import or "-" for active energy export.
Exceeding of the upper or lower indication range is signaled on the display by ^^^^ or vvvv. For

measurement of the averaged values (P DMD, S DMD, I DMD) single measurements are carried out with 0.25 second quantum. Averaging time to choose from: 15, 30 or 60 minutes. Until all samples of the averaged values are acquired, the values are calculated from already measured samples.
Current value in the neutral wire IN is calculated from phase current vectors.

7.1.1. Measurement of voltage and current harmonics

The choice of harmonics is done by selecting the pages dedicated to display the values of voltage harmonics U1, U2, U3 and currents I1, I2, I3 simultaneously for 3-phase (page 11). The number of a displayed harmonics can be changed in the range of 2..51 by the buttons ▼ or ▲
Page 12 shows a bar chart of the harmonics for each phase: voltage at the top and currents at the bottom of the screen. Page 12 shows a bar chart of the harmonics. The choice of displayed harmonics is done by pressing a button **L1,2,3** . The button ⊕ is used to select the groups of harmonics: $harm_2$ - $harm_{26}$, $harm_{27}$ - $harm_{52}$ or $harm_2$ - $harm_{51}$.

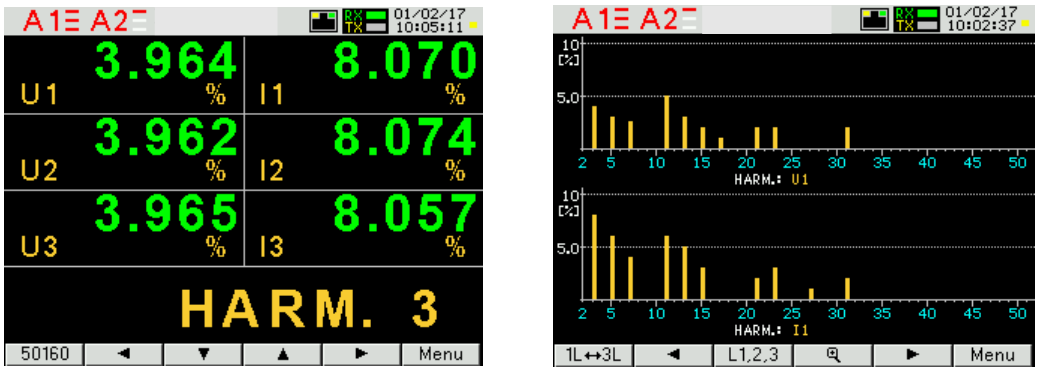

Fig. 13. Screens 11 and 12 - visualization of harmonics

7.2 Parameters mode

This mode is used to determine the parameters of the meter. To enter Parameters mode press the button **Menu** for approx. 3 seconds and next using the button ▲ or ▼ select Parameters mode, to accept press the button **Select**. The parameters configuration mode is protected by a password, if it was entered and it is different from zero. The password prompt is skipped for the password 0000. If the password is incorrect, the message "Wrong password. Read only menu" is displayed. Then it is possible to view the parameters, but the changes are not possible.

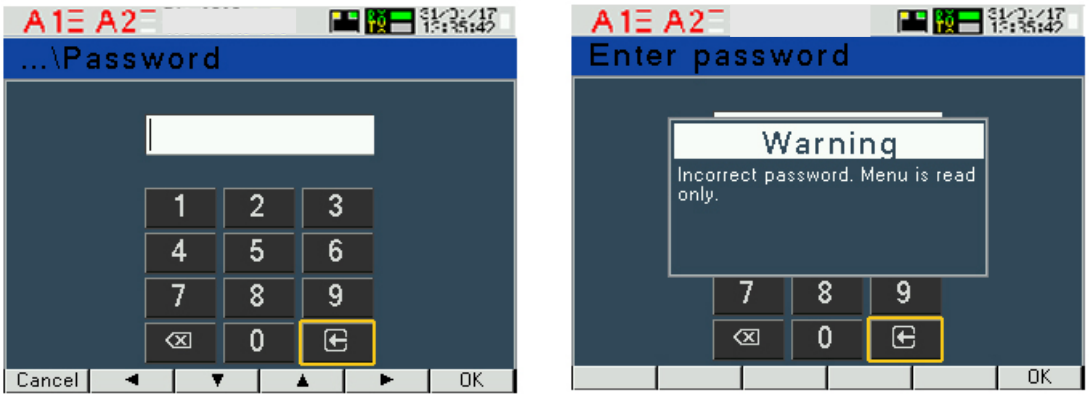

Fig. 14. Screens while entering a password

If the password is correct or it has not been entered, you can set the values according to Table 2.

Buttons ▲ ▼ are used to choose the parameter, to accept press the button **Select**. Then use the buttons ▲ ▼ to choose the features of a parameter or set the requested parameter values, i.e. you can choose the digit in the decimal position by the button ◄ or ► the digit value by the button ▲ or ▼. The active position is signaled by the cursor. Set value or parameter can be accepted by the button **OK** or canceled by pressing **Cancel** . Exit from the Parameters procedure follows pressing simultaneously the button **Esc** or after waiting for approx. 120 seconds. Exit from the Selecting parameters menu follows pressing the button **Exit** or after waiting for approx. 120 seconds.

Entering "Condition upper value" lower then "Condition lower value" disables a condition.

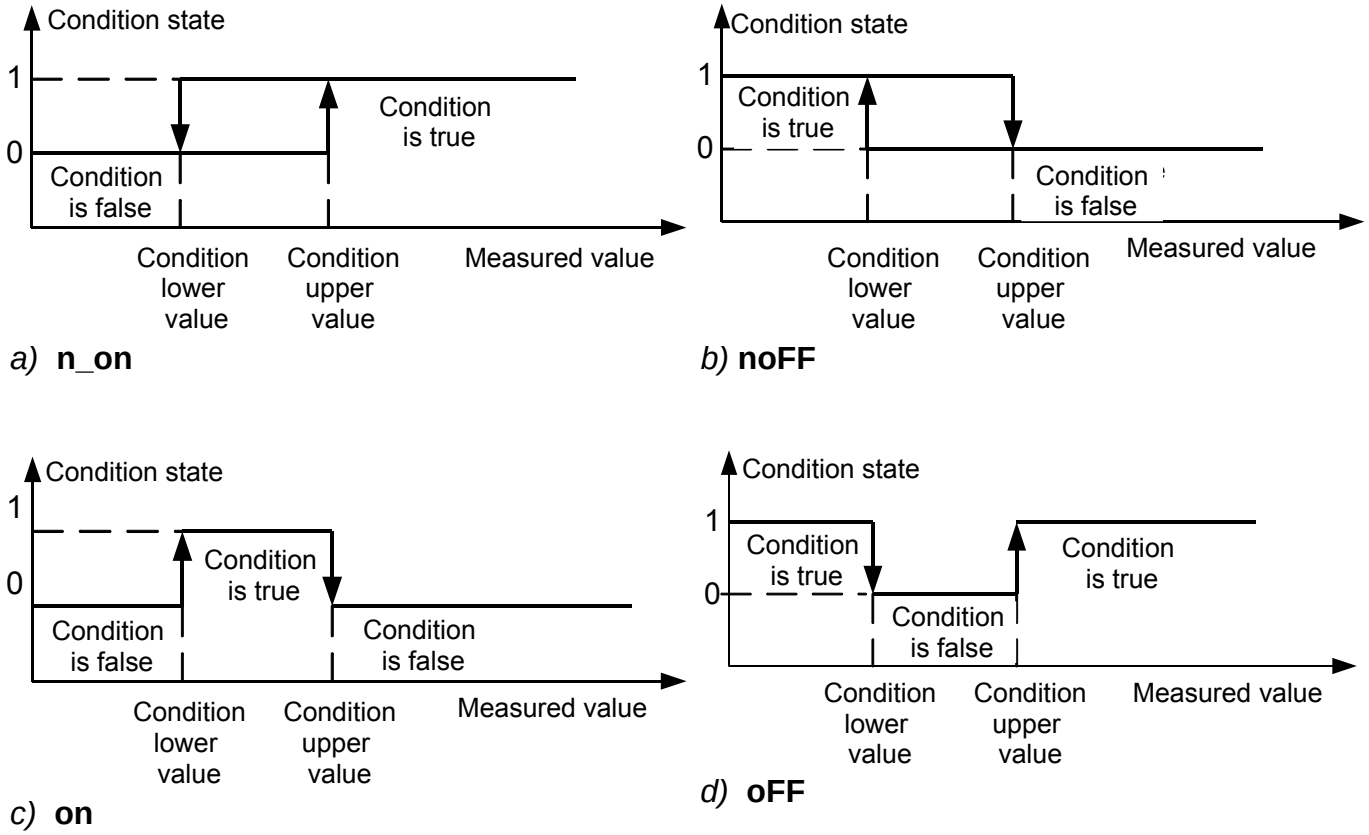

Fig. 17. Condition types: a) n_on b) noFF c) on d) OFF

Remaining types of the condition:

- **H_on** – always true;
- **HoFF** – always not true,
- **3non** – when the measuring value on any phase exceeds the "Condition upper value" - condition is true. The condition will be disabled if the measuring value on all phases will be lower than "Condition lower value".
- **3noF** – when the measuring value on any phase will be lower than the "Condition lower value" -

condition is true. The condition will be disabled if the measuring value on all phases will be higher than "Condition upper value".

- **3_on** – when the measuring value on any phase will be between the "Condition lower value" and "Condition upper value" - condition is true. The condition will be disabled if the measuring value on all phases will be below "Condition lower value" or above "Condition upper value".
- **3_oF** – when the measuring value on any phase will be below the "Condition lower value" or above "Condition upper value" - condition is true. The condition will be disabled if the measuring value on all phases will be between the "Condition lower value" and "Condition upper value".
- The alarm value in the series 3 alarms must be in the range: 01-09, 10-18 and 19-27 (acc. to Table 8). They work with identical thresholds "Condition lower value" and "Condition upper value" for each phase. The blanking of the alarm signalization latch follows pressing the buttons **Del** and **Alarm** (> 3 sec.).

8 SERIAL INTERFACES

8.1 Ethernet / BACnet IP Interface

ND30BAC meters are equipped with a Fast Ethernet interface (100 Mb/s) enabling connection of the meter (using the RJ45 socket) to the Ethernet network. The BACnet IP communication standard described in the PN-EN ISO 16484-5 has been used.

In an Ethernet BACnet IP network, each device is identified by the IP address and port number, as well as by device name and instance number. The port number is fixed and is 47808. Parameters which can be modified in the meter from the level of the Menu are the meter's IP address, the Device object name, the Device object instance number. Below in table 12 there are the most important information about the properties of the implemented BACnet IP protocol. Functional blocks used (appendix K) can be found in table 13.

More information about Analog Input objects and measured quantities they represent can be found in Chapter 9. In case of the Device object, the *ReadPropertyMultiple* function cannot be used due to the lack of segmented messages mechanism. The PICS file for the device can be downloaded from www.lumel.com.pl.

8.2 Connecting Ethernet / BACnet IP interfaces

Connect the device to a TCP/IP network using the RJ45 socket located at the back / terminal side / of the meter (working acc. To EN ISO 16484-5.) to get access to the Ethernet services.

The meter's RJ45 socket LEDs description:

- yellow LED - illuminates when the meter is properly connected to the Ethernet 100 Base-T, does not illuminate when the meter is not connected to a network or is connected to a 10-Base-T.
- green LED - Tx/Rx, illuminates (irregularly illuminates) when the meter sends and receives data, illuminates continuously when no data is transmitted

To connect the meter to the network, use wire twisted pair of STP type (shielded) CAT 5 - for high-speed local area networks, frequency bandwidth up to 100 MHz according to the European standard EN 50173 with RJ-45 plug with core color (according to Table 14) in the following standard :

• EIA/TIA 568A for both connectors at the so-called simple connection of ND30PNET to the network hub or switch,

• EIA/TIA 568A for the first connector and EIA/TIA 568B for the second connector at the so-called patch cord connection (crossover) used, among others, when connecting ND30PNET to the computer.

8.3 RS485 INTERFACE – list of parameters

The implemented protocol is compliant with the PI-MBUS-300 Rev G specification of Modicon. List of ND30BAC meter serial interface parameters:

- identifier 0xE5
- meter address 1..247,
- baud rate 4.8, 9.6, 19.2, 38.4, 57.6, 115.2 kbit/s

- operating mode — Modbus RTU
- transmission mode — 8N2, 8E1, 8O1, 8N1
- max. response time — 600 ms
- max. no. of registers read in a single query
  - 61 – for 4-byte registers
  - 122 – for 2-byte registers
- implemented functions
  - 03, 04, 06, 16, 17
  - 03, 04 register readout
  - 06 single register writing
  - 16 writing of n-registers,
  - 17 device identification

Default settings: address 1, baud rate 9.6 kbit/s, mode RTU 8N2

8.4 Examples of registers' readout and write

Readout of n-registers (code 03h)

Example 1. Readout of two 16-bit integer registers, starting with the register address 0FA0h (4000) - register values 10, 100.

Request:

Device address	Function	Register address		Number of registers		CRC checksum
		B1	B0	B1	B0	
01	03	0F	A0	00	02	C7 3D

Response:

9 ND30BAC METER DATA STRUCTURE

In the ND30BAC meter, the data can be read using the BACnet IP protocol by reading the properties of individual objects configured in the device. The data can also be read using the RS485 interface and the ModBus protocol by reference to individual registers.

9.1 Data structure for the Ethernet / BACnet IP interface

The meter has two types of objects. This is a DEVICE type object and an ANALOG INPUT type object. The first of them occurs once. From the object one can read basic information about the meter, such as the name of the device, the instance number. The ANALOG INPUT objects are used to read measurement data. The measured value is contained in a variable called Present Value. Table 15 contains a list of the most important properties of ANALOG INPUT objects.

9.2 Registers structure for RS-485 / Modbus interface

In the ND30BAC meter, data are placed in 16 and 32-bit registers. Process variables and meter parameters are placed in the address area of registers in a way depended on the variable value type. Bits in 16-bit register are numbered from the youngest to the oldest (b0-b15). The 32-bit registers contain numbers of float type in IEEE-754 standard. 3210 byte sequence - the oldest is sent first.

Table 16

Address range	Value type	Description
4000 – 4159	Integer (16 bits)	Value set in the 16-bit register. Registers for meter configuration. Description of registers is shown in Table 17. Registers for writing and readout.
4200 – 4260	Integer (16 bits)	Value set in the 16-bit register. Registers for configuration of programmable group of registers for readout. Description of registers is shown in Table 18. Registers for writing and readout.
4300 - 4385	Integer (16 bits)	Value set in the 16-bit register. Registers for displayed pages configuration. Description of registers is shown in Table 20. Registers for writing and readout.
4400- 4485	Integer (16 bits)	Value set in the 16-bit register. Status registers, energy value, MAC address of the meter, configuration data. Description of registers is shown in Table 21. Readout registers.
6000 – 6982	Float (2x16 bits)	Value is set in the two following 16-bit registers. Registers contain exactly the same data, as 32-bit registers of 7500 – 7953 range. Readout registers. Bytes sequence (1-0-3-2)
7000 - 7118	Float (2x16 bits)	Content of the registers set in the registers 4200 – 4359. Bytes sequence (3-2-1-0) (see table 19)
7200 – 7318	Float (2x16 bits)	Content of the registers set in the registers 4200 – 4359. Bytes sequence (1-0-3-2) (see table 19)
7400 - 7459	Float (32 bits)	Content of the registers set in the registers 4200 – 4359. Values set in one 32-bit register. (see table 19)
7500 – 7991	Float (32 bits)	Values set in one 32-bit register. Description of registers is shown in Table 22. Readout registers.
8000 - 8982	Float (2x16 bits)	Value is set in the two following 16-bit registers. Registers contain exactly the same data, as 32-bit registers of 7500 – 7953 range. Readout registers. Bytes sequence (3-2-1-0)

Energy is made available in hundreds of watt-hours (var-hours) in double 16-bit register, and for this reason, you should divide them by 100 when calculating values of particular energy from registers, e.g.:

Active import energy = (reg. value 4426 x 65536 + reg. value 4427) / 100 [kWh]
Active export energy = (reg. value 4428 x 65536 + reg. value 4429) / 100 [kWh]
Reactive inductive energy = (reg. value 4430 x 65536 + reg. value 4431) / 100 [kVarh]
Reactive capacity energy = (reg. value 4432 x 65536 + reg. value 4433) / 100 [kVarh]
Apparent energy = (reg. value 4434 x 65536 + reg. value 4435) / 100 [kVAh]

Similarly, energy from registers 4462 to 4485 should be converted

Status 1 Register of a device (address 4415, R):

Bit 15 – "1" – FRAM memory damage
Bit 14 – "1" – no calibration of the input
Bit 13 – "1" – no calibration of the output
Bit 12 – "1" – PT100 calibration error
Bit 11 – "1" – error in configuration registers
Bit 10 – "1" – error in displayed pages registers
Bit 9 – "1" – error in registers for configuration of programmable group of registers for readout
Bit 8 – "1" – energy value error
Bit 7 – "1" – phase sequence error
Bit 6 – "1" – reserved
Bit 5 – "1" – error in the supervisory relay registers
Bit 4 – "1" – presence of an analog output
Bit 3 – "1" – presence of Pt100
Bit 2 – "1" – present Ethernet and internal memory
Bit 1 – "1" – used battery of RTC
Bit 0 – reserved

Status 2 Register – (address 4416, R):

Bit 15 – "1" – condition 3 for alarm 2 signalization
Bit 14 – "1" – condition 2 for alarm 2 signalization
Bit 13 – "1" – condition 1 for alarm 2 signalization
Bit 12 – "1" – alarm 2 signalization
Bit 11 – "1" – alarm 2 condition 3 activated
Bit 10 – "1" – alarm 2 condition 2 activated
Bit 9 – "1" – alarm 2 condition 1 activated
Bit 8 – "1" – alarm 2 activated
Bit 7 – "1" – condition 3 for alarm 1 signalization
Bit 6 – "1" – condition 2 for alarm 1 signalization
Bit 5 – "1" – condition 1 for alarm 1 signalization
Bit 4 – "1" – alarm 1 signalization
Bit 3 – "1" – alarm 1 condition 3 activated
Bit 2 – "1" – alarm 1 condition 2 activated
Bit 1 – "1" – alarm 1 condition 1 activated
Bit 0 – "1" – alarm 1 activated

Bit 2 – "1" – capacity L1 maximum
Bit 1 – "1" – capacity L1 minimum
Bit 0 – "1" – capacity L1

Status 5 Register – (address 4419, R)

Bit 8 – "1" – alarm 1 condition 3 for phase L3 active
Bit 7 – "1" – alarm 1 condition 3 for phase L2 active
Bit 6 – "1" – alarm 1 condition 3 for phase L1 active
Bit 5 – "1" – alarm 1 condition 2 for phase L3 active
Bit 4 – "1" – alarm 1 condition 2 for phase L2 active
Bit 3 – "1" – alarm 1 condition 2 for phase L1 active
Bit 2 – "1" – alarm 1 condition 1 for phase L3 active
Bit 1 – "1" – alarm 1 condition 1 for phase L2 active
Bit 0 – "1" – alarm 1 condition 1 for phase L1 active

Status 6 Register – (address 4420, R)

Bit 8 – "1" – alarm 2 condition 3 for phase L3 active
Bit 7 – "1" – alarm 2 condition 3 for phase L2 active
Bit 6 – "1" – alarm 2 condition 3 for phase L1 active
Bit 5 – "1" – alarm 2 condition 2 for phase L3 active
Bit 4 – "1" – alarm 2 condition 2 for phase L2 active
Bit 3 – "1" – alarm 2 condition 2 for phase L1 active
Bit 2 – "1" – alarm 2 condition 1 for phase L3 active
Bit 1 – "1" – alarm 2 condition 1 for phase L2 active
Bit 0 – "1" – alarm 2 condition 1 for phase L1 active

10 SOFTWARE UPGRADE

10.1 Firmware update - main program of the meter

A feature implemented in the ND30BAC meters enables to upgrade firmware using a PC with eCon software installed. Free eCon software and the update files are available at www.lumel.com.pl. Upgrade of meter software (firmware) can be done via RS-485 interface. Go to LUMEL UPDATER tab to upgrade.

a) b)

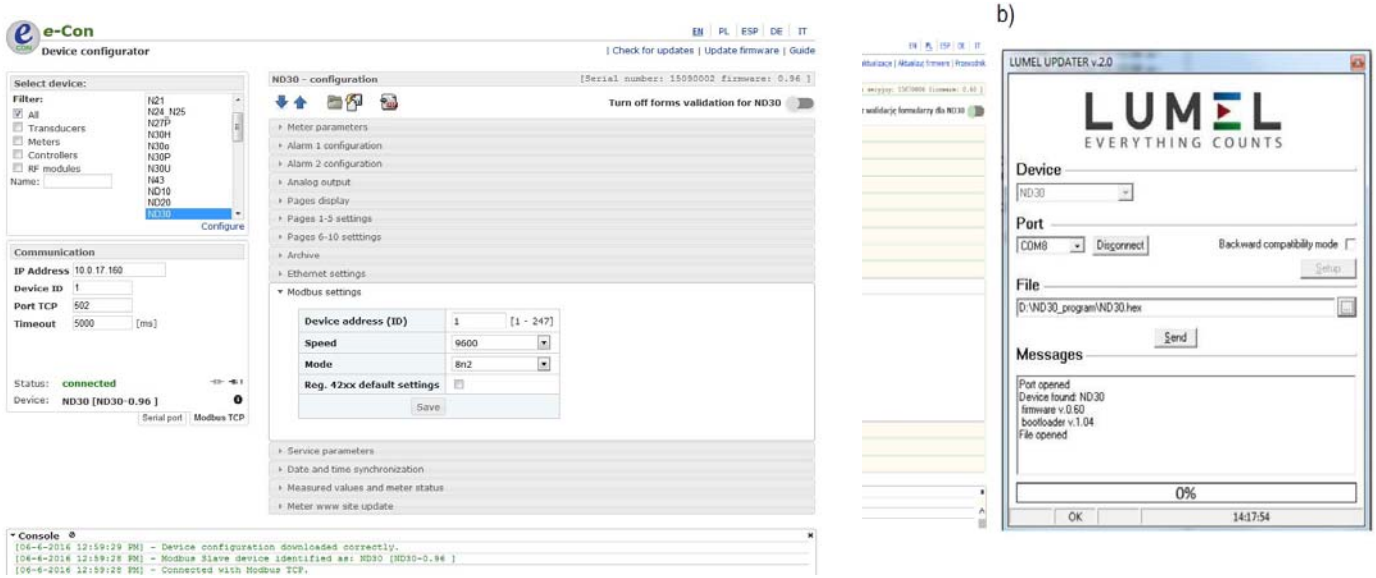

Fig. 25. Program window view: a) eCon, b) software upgrade

Note: Software update automatically resets meter settings to default settings, so it is recommended to

save meter settings using eCon software before upgrading.
After launching eCon software, set in the settings required serial port, baud rate, mode and address of the meter. Next, select the ND30BAC meter and click *Config*. Click the down arrow icon to read all of the settings then the disk icon to save the settings to a file (required to restore the settings later). After selecting the option *Update firmware* (in the upper right corner of the screen) the window *Lumel Updater (LU)* will *be opened* – Fig. 25. Click *Connect*. The *Messages* information window displays information concerning upgrade process. If the port is opened correctly, a *Port opened* message appears. Upgrade mode is enabled using either of the two methods: remotely via LU (using eCon settings: address, mode, baud rate, COM port) and by turning a meter on while pressing the button ↵ (while entering bootloader mode the button is used to set communication settings: baud rate 9600, RTU8N2, address 1). The display will show the bootloader version, while the LU program displays the message *Device found* and the name and version of the connected device. Click the "***...***" button and browse to the meter upgrade file. If the file is opened correctly, *File opened* message is displayed. Press the *Send* button. When upgrade is successfully completed, the meter begins normal work while the information window displays *Done* message and upgrade elapsed time. After the LU window is closed, go to parameter group *Service parameters*, select the option *Set default settings of a meter* and press a button *Restore*. Then press the folder icon to open a previously saved settings file and press the up arrow icon to save the settings in the meter. Current software version can be checked by reading the welcome message when switching the meter on.
Note: Turning meter supply off during upgrade process may result in permanent damage!

11 ERROR CODES

During the meter operation the error messages may be displayed. Following list shows reasons of errors.

Error:

- MEMORY FR, - CAL INP, - CAL AN, - CAL Pt, - SD CARD – displayed when the memory in the meter has been damaged. The meter should be sent to the manufacturer.

- PAR.CFG – displayed when the operating parameters of the meter are incorrect. The factory settings should be restored (from the "Settings -> Factory settings" menu level or via RS485).

- PAR.PAGE – displayed when parameters related to the configuration of the displayed parameters in the meter are incorrect. Restore factory settings (from the menu "Display -> Settings -> Factory settings of pages" or via RS485).

- PAR.READ – displayed when parameters related to registers from the modbus 42xx address group are incorrect. The factory settings should be restored (from the "Modbus -> Factory settings reg. 42x" menu level or via RS485).

- ENERGY – displayed when an error occurs in the value of one of the energy meters. Restore the factory settings (from the "Parameters -> Energy count reset" menu or via RS485).

- ^^^^ – upper overrun. Measuring value is out of the measuring range.
- vvvv – lower overrun. Measuring value is out of the measuring range.
